Your industrial batteries in safe hands

Beside battery sorting and consultancy we also work for nationally operating wholesalers in the automotive industry. The annual collecting of old lead acid batteries amounts to several thousands of tons. But also do we collect non-ferrous metals like old license plates, rims and car spent catalytic converters.

These large quantities of material require a sophisticated logistic system. For years, Van Peperzeel has been working according to a firm concept, the so-called Van Peperzeel model. This model is just as simple as effective.

- Collection boxes for batteries or residues are available for sale or rent.
- Report a pick-up of your material by means of phone, fax or our website
- Collecting and replacing occurs within ten days after reporting
- A complete logistically and administratively transaction

At our premises in Lelystad five dock shelters are available to ensure a smooth logistic. The Van Peperzeel model has been designed in order to meet the market demand and also because of years of experience with collecting and knowledge in materials. The model is put into practice when materials are collected, sorted and processed and also serves as a basis for the developing of new collecting systems in a variety of EU countries.

Of course, all processes are carefully planned and we have the necessary licenses and certifications to ensure the safe management and proper implementation. Van Peperzeel is ISO 9001 & 14001 certified and is a member of the EBRA & the MRF. Van Peperzeel provides a reliable, flexible and safe collection of your waste products. Also your company can benefit from this. We gladly take all (environmental) care out of your hands.

Van Peperzeel B.V. is together with the French secondary lead smelter Métalblanc a member of the Coelho Group. This means that Van Peperzeel is closely connected to the smelter, and as such forms the last logistical link before the material becomes recycled. You can be sure that your old batteries are in safe hands!
